What is Thermal Radiation?

Thermal radiation is a mode of heat transfer that involves the emission of electromagnetic waves, primarily in the infrared spectrum, from the surface of a body due to its temperature. Unlike conduction and convection, thermal radiation does not require a medium and can occur across a vacuum. It plays a vital role in numerous engineering applications, including thermal insulation, radiative cooling, solar energy systems, and astrophysics.

Key Principles of Thermal Radiation

- Emissivity: A measure of a real body's ability to emit thermal radiation relative to a blackbody.
- Planck's Law: Describes the spectral distribution of radiation emitted by a blackbody.
- Stefan-Boltzmann Law: Relates the total emitted radiation to the fourth power of temperature.
- Kirchhoff's Law: States that a body's emissivity equals its absorptivity at thermal equilibrium.
